Software Upgrade Kickoff

To better serve our customers and ensure technical compatibility, Moss Supply has officially begun a new project. Over the next few months, the I.T. department and [Infor](#), will be working to upgrade our business systems to a newer version.

Warning: Technical jargon to follow....

To keep up with compatibility issues and the increasing demand for mobile devices, we will be rebuilding our product configurator and online ordering system to allow a product that is compatible with the newest operating systems (Windows 10) and internet browsers (Chrome, Safari, etc.). The difference between an upgrade and a new system means; everything we have developed will carry forward, streamline data migration and accelerate the implementation.

Some of our project goals include:

- Compatibility with current browsers
- Graphic catalog selection
- Sourcing warehouse calculation
- Lead time calculations
- Mobile device quoting/ordering
- New development environment

Hardware upgrades are also underway. New powerful Windows 2012 servers and a new AS400 mainframe will ensure performance accompanies our new functionality.

Although the go-live is still a few months off, we are excited to finally begin developing functionality that comes with this upgrade. We think you will like what you see.
